
Regen10 Webinar

A Deep Dive into Frameworks

Agenda

- 0:00 Welcome & Agenda Review
- 0:10 Landscapes Overview
- 0:15 A Deep Dive into Frameworks
- 0:30 How to get involved?
- 0:35 Q & A
- 1:00 Next Steps and Adjourn

What would it take over this decade for 50% of the world's food to be produced in a way that provides positive outcomes for people, nature and climate, providing affordable nutritious food for 10 billion people?

Regen10 Approach

Farmer Centricity

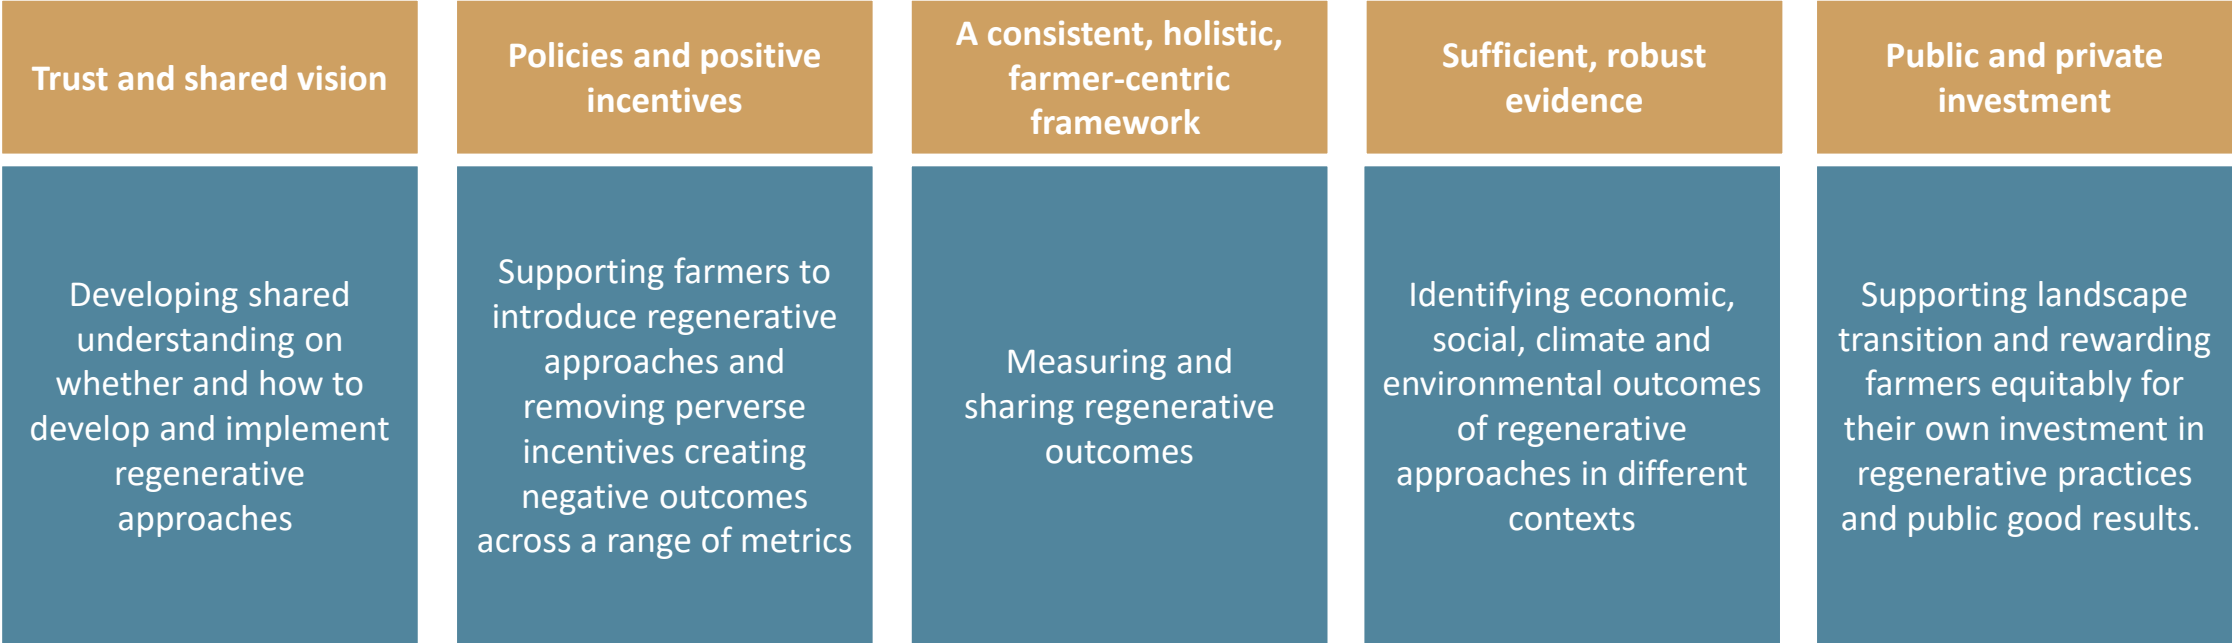

Farmers are central, equitable, and empowered actors in the transition to regenerative food systems

Deep Inclusion

Including traditionally marginalized voices and wider food system actors

What needs to change?

Strategic Priorities

1. Establish a Regenerative Outcomes Framework

Consultative process to develop the principles, metrics, and framework needed to build inclusive, productive and regenerative food system

2. Learn from Landscapes to integrate, scale and connect

Draw on existing initiatives to accelerate farmer centric, inclusive landscape level transitions to regenerative food systems

3. Build a global movement to drive change for people, nature and climate

Inclusive, global collaborative platform to identify how policy, business, finance, research and capacity building can best support approaches that deliver positive outcomes for people, nature and climate

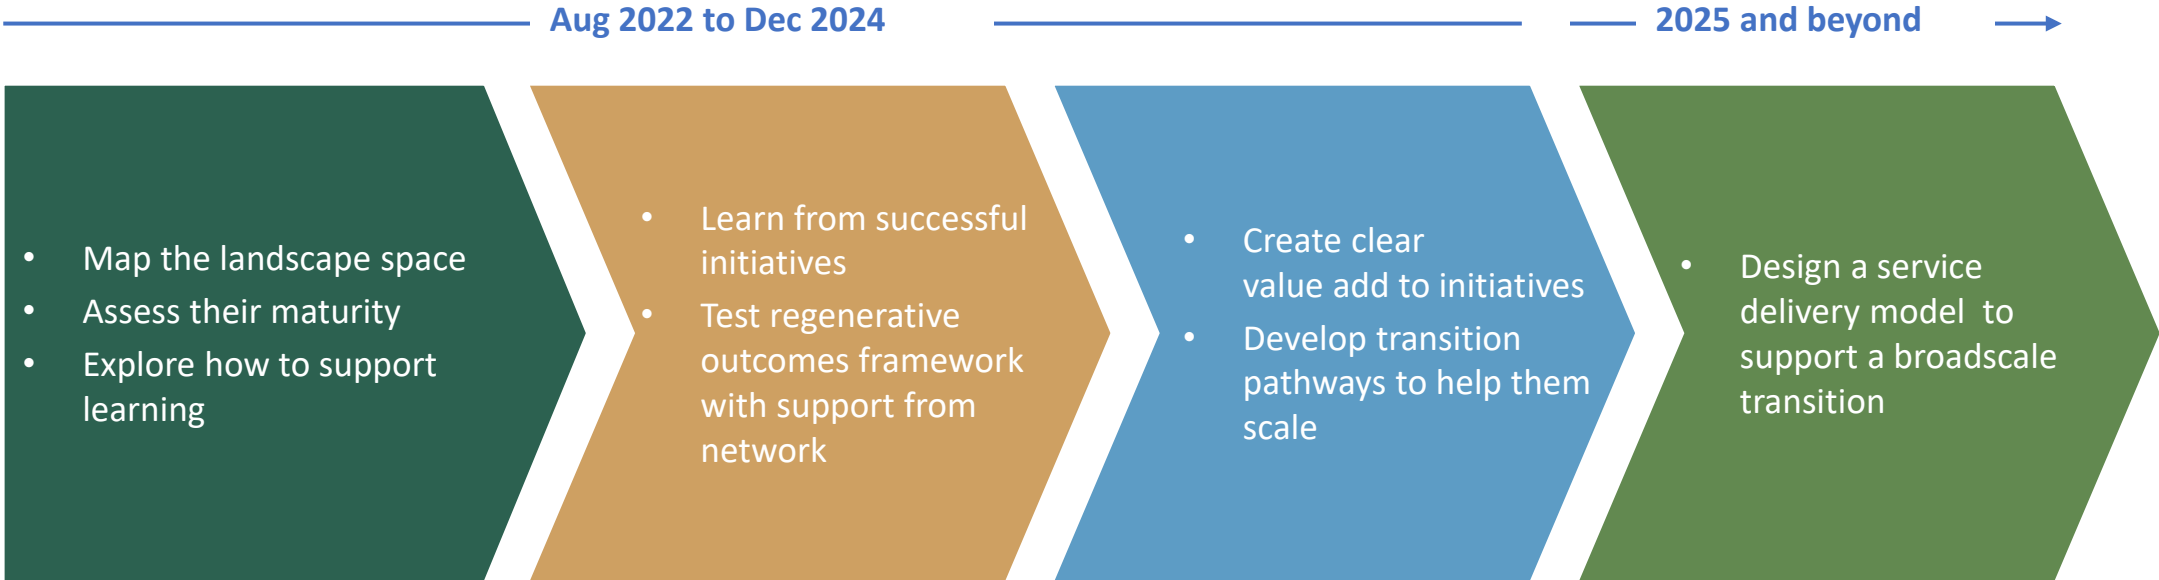

Next Steps

Learn from Landscapes to integrate, scale and connect

1. Learn from ground-up how best to enable, accelerate, and scale regenerative systems
2. Provide connectivity, learning, and overcome tension and gaps within and between existing landscape-level initiatives and their actors.
3. Support and accelerate broadscale transition in landscapes

Learn from Landscapes to integrate, scale and connect

Strategic Priority: Regenerative Outcomes Framework

Regen10 Webinar March 24th 2023

The problem: The way that agriculture is measured and reported to date is preventing the world from achieving its sustainability targets

The problem can be distilled into four buckets:

1. Focus on practices over outcomes

A focus on practices to define regenerative agriculture can lead to unintended consequences

2. Fragmented data collection and reporting

Fragmented data collection and reporting across environment, climate and social impacts can cause trade-offs and creates barriers to scale

3. Lack of inclusivity

Farmers and indigenous experiences are excluded from the conversations resulting in unbalanced power dynamics and missed opportunities

4. Lack of framework for guiding agriculture and incentives

Our analysis of existing and emerging frameworks shows that there is no universal holistic outcomes framework that has been tried and tested universally, and that incentivises primary data collection at farm and landscape level

To address these issues, Regen10's frameworks team have identified two key areas of work

Two key areas of work

1

Identify **principles of regenerative food systems** to provide the **overarching systems vision** for what the framework seeks to achieve.

The principles will **build on existing work** and be **validated through a robust stakeholder engagement process**

2

Harmonise stakeholders around a **regenerative outcomes framework**, and **core set of metrics**, that enables **primary data collection at the farm and landscape level**.

The framework will allow food system actors to **properly measure agricultural outcomes** to inform practices, **guide incentives**, **validate data flows**, and **drive innovation and adaptation**.

The Food and Land Use Coalition's 2023 Report calls for an outcomes-based framework to properly measure and assess agriculture

Aligning regenerative agricultural practices with outcomes to deliver for people, nature and climate

January 2023

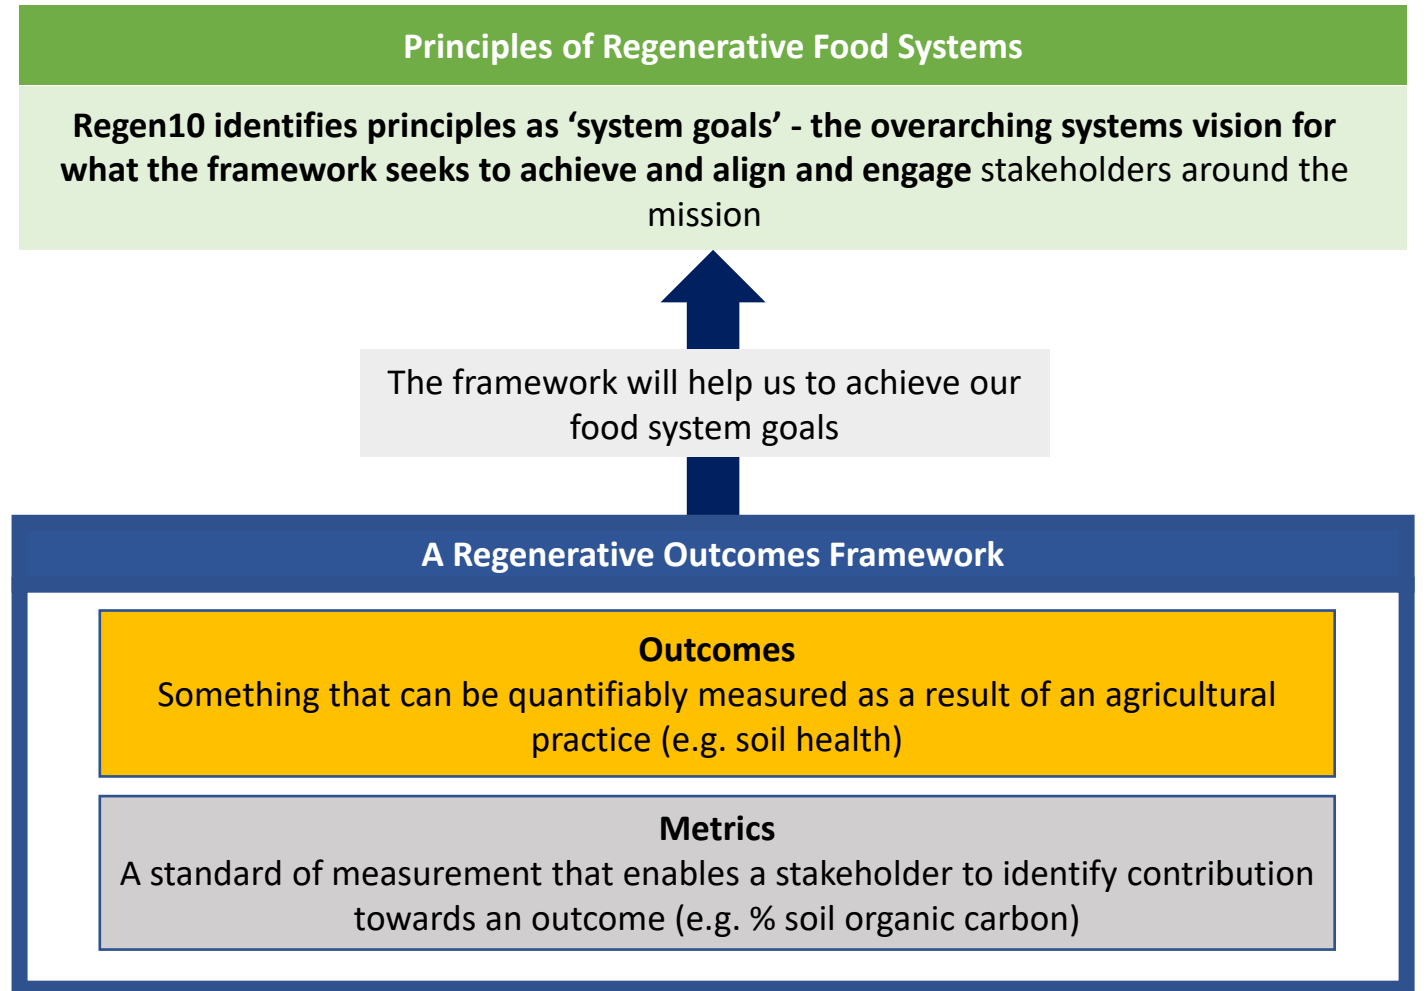

1. Regen10 seeks to identify principles of regenerative food systems that will provide the overarching systems vision for what the framework seeks to achieve

An assessment of over 100 principles revealed there are three categories of principles:

- a) **Actions** that should be taken on farm
- b) **Measurable outcomes** e.g. wage, biodiversity
- c) **System goals** like ensuring system resilience

Regen10 identifies principles as '**System goals**'

2. A holistic outcomes-based framework and standardised metrics will better inform stakeholders, guide incentives and validate data flows throughout the system

From...

Farmers

Difficulty sharing data and learning across farms and landscapes due to inconsistent metrics.
Lack of incentives to collect and share data

Business

Corporate sustainability reporting based on modelled secondary data that differs across data sets and uses averages, not primary data

Policy

Lack of data accessibility to inform policy incentives and perverse govt. subsidies causing degradation

Finance

Investors are not able to identify sustainable investments due to lack of data accessibility

Consumers

Lack of clarity for consumers on sustainable purchasing decisions & greenwashing

...To

Knowledge sharing across farms and landscapes to inform adaptation and management. Farmers benefit from collecting and sharing data via incentives

Business have access to granular primary data or accurate secondary data* to validate and inform impact reporting and disclosure

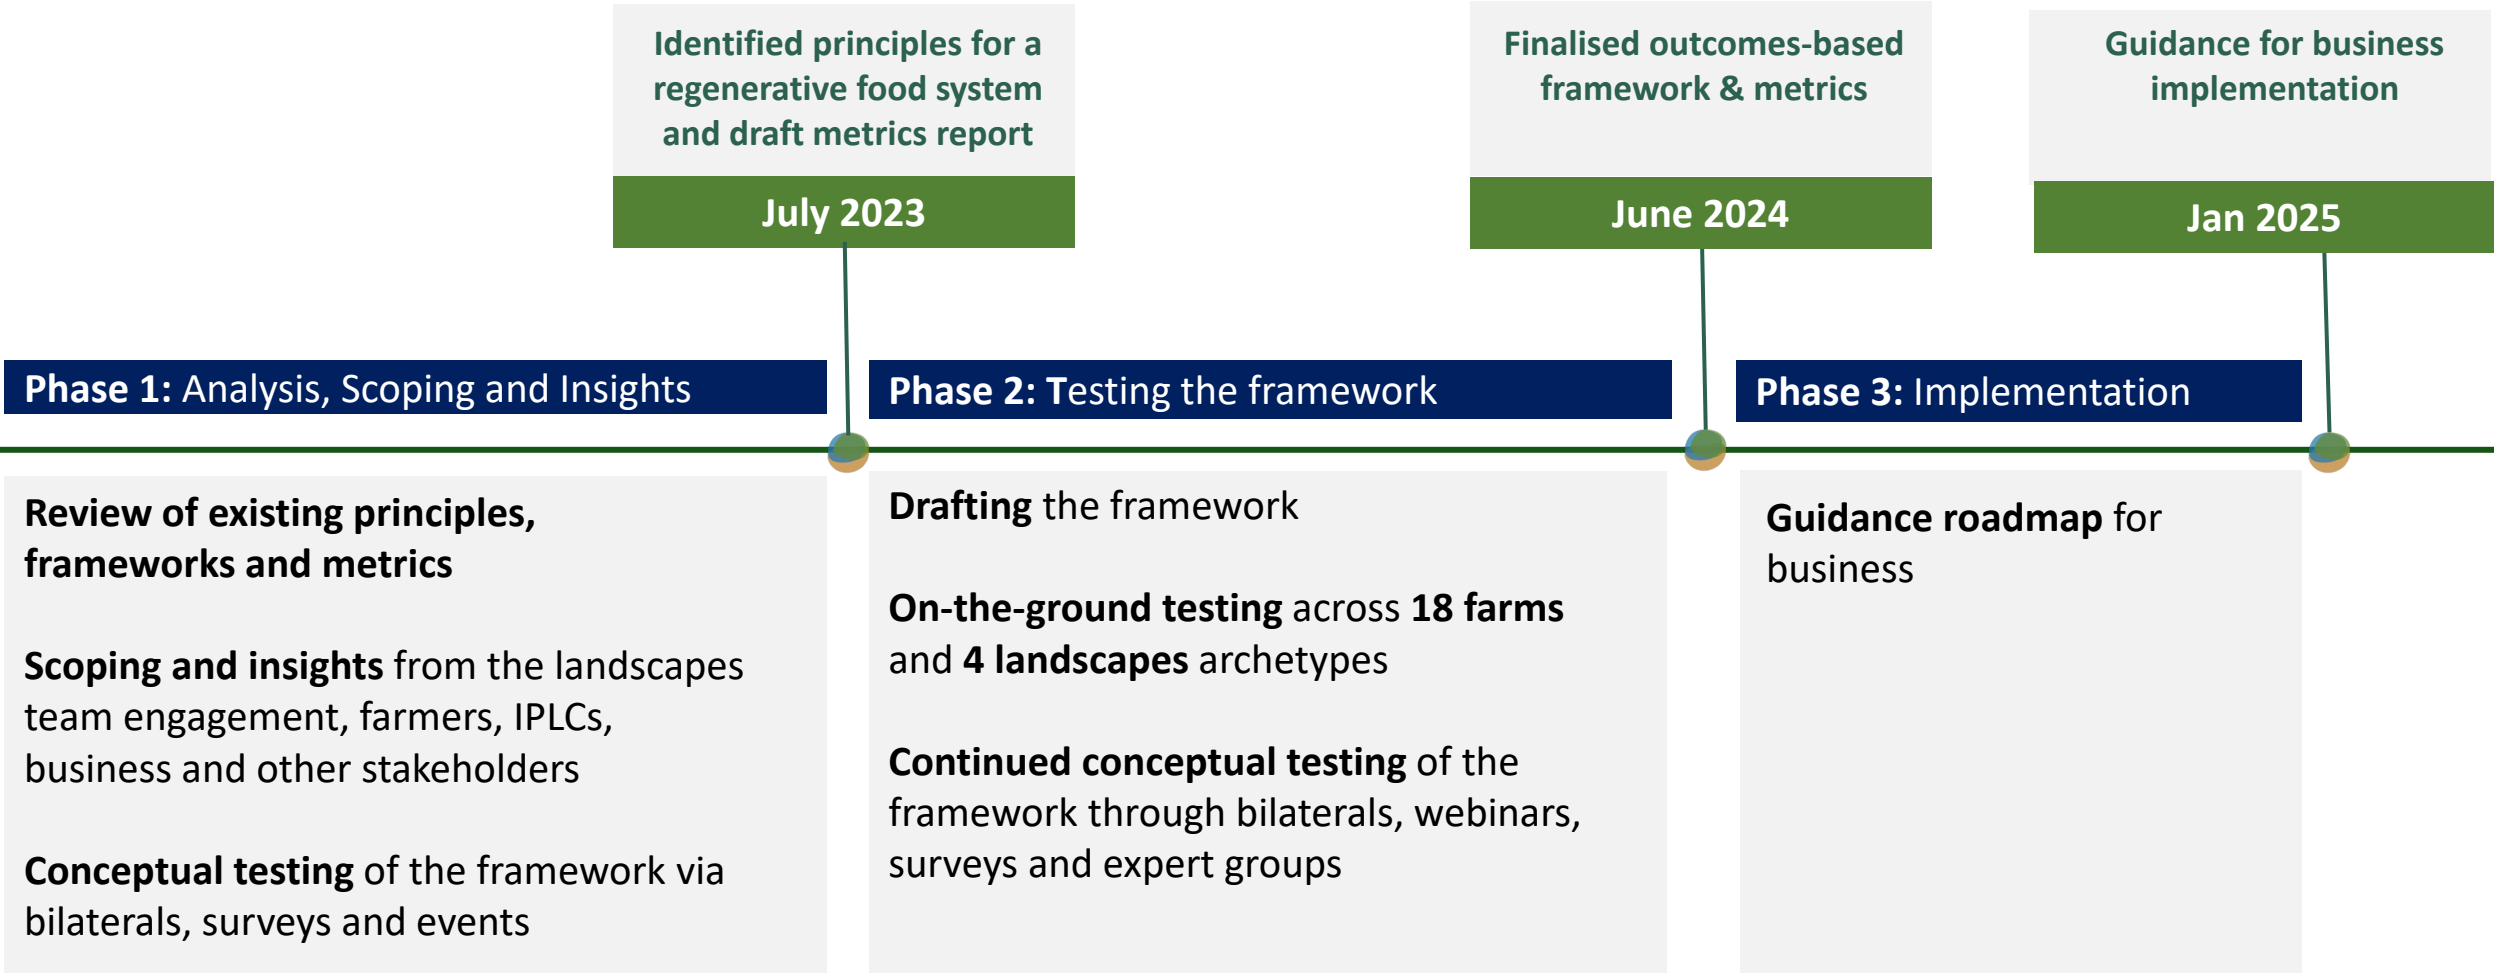

Farmers provide primary data to govts. to receive subsidies based on positive outcomes

Farmers use outcomes data to receive loans from investors & business receives investment based on positive outcomes

Farmers and business can validate their marketing to consumers

*primary data collection will better inform modelled data used for scope 3 impact evaluation

The timeline for the development of the regenerative outcomes framework
